disorders involving aberrant protein expression or biology The polypeptide and polynucleotide sequences have applicat diagnostics, forensics, gene mapping, identification of must responsible for genetic disorders or other traits to assess and to produce other types of data and products dependent amino acid sequences. ABG00010-ABG30377 represent novel humalization acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIF at fig. wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Similarity

ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at fifty. Wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mittations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 20; SEQ ID No 40090; 103pp; English

                                                                                                        therapy of prostate cancer, optionally where expressed by gene therapy methods. (A) is also used to isolate full-length genes (for gene therapy) and for recombinant production of (I), which can be used to raise specific antibodies. (A) are identified by assembly of ESTS (expressed sequence tags) before they are analyzed for expression pattern (tissue specificity). This approach eliminates many of the false results, as regards tissue specificity, associated with known methods that use single (usually short) ESTs. AAY48215-Y48303 represent protein fragments encoded by the expressed sequence tags described in the method of the
                                                                                                                                                                                                                                                   This invention describes novel nucleic acid sequences (A) that are expressed at high level in prostatic tumor tissue and encode gene products or their fragments. The products of the invention have antitumor activity. Polypeptides (I) encoded by (A) are used: (i) for identifying agents for treatment of prostatic cancer and (ii) for
                                                                   Sequence
                                                                                                                                                                                                                                                                                                                                                                                      New nucleic acid expressed at high level in prostatic tumor tissue encoded polypeptides, useful for treating cancer and screening for therapeutic agents \,

                                                                                                                                                                         expressed at high level in prostatic tumor tissue and encode gene products or their fragments. The products of the invention have antitumor activity. Polypeptides (I) encoded by (A) are used: (i) for identifying agents for treatment of prostatic cancer and (ii) for therapy of prostate cancer, optionally where expressed by gene therapy methods. (A) is also used to isolate full-length genes (for gene therapy) and for recombinant production of (I), which can be used to raise specific antibodies. (A) are identified by assembly of ESTs (expressed sequence tags) before they are analyzed for expression pattern (tissue specificity). This approach eliminates many of the false results, as regards tissue specificity, associated with known methods that use single (usually short) ESTs. AAY48215-Y48303 represent protein fragments encoded by the expressed sequence tags described in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim 22; 112-113; 166pp; German.

RESULT 7
AAM50813
The present sequence is that of an immunogenic polypeptide comprising amino acids 393-441 of human prostate-specific PS118 polypeptide (see AAM50809). A PS118 consensus sequence (see ABA9151) is found at least 12 times more often in prostate than in non-prostate tissue. PS118 polypeptides, polynucleotides, antibodies, agonists and inhibitors are useful for detecting, diagnosing, staging, monitoring, prognosticating, preventing and treating (including by genetic immunisation), or determining the prostate, such as benign prostatic interaptibelial neoplasia, prostate cancer, tumours and metastases. The PS118 polypeptides can be produced by expression of PS118 polynucleotides in transfected host cells, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Billing-Medel PA, Co

        CC polymerase chain reaction (PCR) primers, olligomers, and for chromosome C and gene mapping, and in recombinant production of (II). The CC polymucleotides are also used in diagnostics as expressed sequence tags CC for identifying expressed genes. (I) is useful in gene therapy techniques CC (II). (II) is useful for generating antibodies against it, detecting or CC (II). (II) is useful for generating antibodies against it, detecting or CC quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical climaging of sites expressing (II). (I) and (II) are useful for treating CC disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in CC diagnostics, forensics, gene mapping, identification of mutations CC responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and CC amino acid sequences. ABG00010-ABG3037 represent novel human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   antibodies of diagnostic use. The methods and reagents of the invention may provide an early means of detecting diseases of the prostate and may also provide new markers which can differentiate between the clinically important and unimportant prostate cancers without the use of surgery.

       polypeptide (see AAM50809). A PS118 consensus sequence (see ABA91651) is found at least 12 times more often in prostate than in non-prostate tissue. PS118 polypeptides, polynucleotides, antibodies, agonists and inhibitors are useful for detecting, diagnosing, staging, monitoring, prognosticating, preventing and treating (including by genetic immunisation), or determining the predisposition of an individual to, diseases and conditions of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          prostatic intraepithelial neoplasia, prostate cancer, tumours and metastases. The PSII8 polypeptides can be produced by expression of PSII8 polynucleotides in transfected host cells, and immunogenic peptides are useful for raising PSII8-specific antibodies of diagnostic use. The methods and reagents of the invention may provide an early means of detecting diseases of the prostate and may also provide new markers which can differentiate between the clinically important and unimportant prostate cancers
The present sequence is that of an immunogenic polypeptide comprising amino acids 332-371 of human prostate-specific PS118 polypeptide (see AAM50809). A PS118 consensus sequence (see ABA91651) is found at least 12 times more often in prostate than
                                                                                                          Claim 17;
                                                                                                                                                           Detecting presence of target PS118 polynucleotide in useful for detecting, diagnosing, staging, monitoring preventing or treating or determining predisposition disease.
                                                                                                                                                                                                                                                             WPI; 2002-187683/24.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               in non-prostate tissue. PS118 polypeptides, polynucleotides, antibodies, agonists and inhibitors are useful for detecting, diagnosing, staging, monitoring, prognosticating, preventing and treating (including by genetic immunisation), or determining the predisposition of an individual to, diseases and conditions of the prostate, such as benign prostatic hyperplasia, prostatitis, prostatic intraepithelial neoplasia, prostate cancer, tumours and metastases. The PS118 polypeptides can be produced by expression of PS118 polynucleotides in transfected host cells, and immunogenic peptides are useful for raising PS118-specific antibodies of diagnostic use. The methods and reagents of the prostate and may also provide new markers which can differentiate between the clinically important and unimportant prostate cancers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

The invent useful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), appressed DNA sequences (ABL16175) and the encoded proteins (ABBS7737-ABB72072)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to novel human proteins (NHP) encoding polynucleotides. The NHP cDNA is used in gene therapy. The NHPs that share sequence similarity with mammalian GPT-anchored P137 protein, cerebellin and C1Q proteins, are useful in the treatment of a disease involving NHP, for detecting mutant NHPs or inappropriately expressed NHPs for the diagnosis of disease, for screening drugs effective in treatment of symptomatic or phenotypic manifestations of perturbing the normal function of NHP in the body. The NHP can be targetted in order to treat disease or to therapeutically augment the efficacy of chemotherapeutic agents used in the treatment of cancer, inflammation and hormonal disorders. Oligonucleotides complementary to NHPs may approach the streatment of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              encode or act as NHP antisense molecules, or may be used as part of ribozyme and/or triple helix sequences. Addressable arrays comprising the NHP can be used to identify and characterise the tissue expression of a gene. The use of addressable arrays comprising the NHP provide detailed information about transcriptional changes involved in specific pathway, potentially leading to the identification of novel components or gene functions that manifest themselves as novel phenotypes. The NHPs are also useful for identifying mutations associated with a particular disease. The present sequence is a NHP.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel human polynucleotides encoding proteins that share sequence similarity with mammalian membrane proteins, useful as hybridization probes for screening libraries and assessing gene expression patterns
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Disclosure; Page 79-80; 94pp; English.

Pred. No. score grea and is der

greater

musculu

```
No. is the number of results predicted by chance to have a greater than or equal to the score of the result being printed, derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             of hits satisfying chosen parameters:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        June 17, 2003, 11:48:41; Search time 2.10102 Seconds (without alignments) 690.935 Million cell updates/sec

FUNCTION: THIS IS CALCIUM-INDEPENDENT, PHOSPHOLIPID-BEPENDENT,
SERINE- AND THEGONINE-SPECIFIC ENZYME.
SERINE- AND THEGONINE-SPECIFIC ENZYME.
FUNCTION: PKC IS ACTIVATED BY DIACYLGLYCEROL WHICH IN TURN
PHOSPHORYLATES A RANGE OF CELLULAR PROTEINS. PKC ALSO SERVES A
THE RECEPTOR FOR PHORBOL ESTERS, A CLASS OF TUMOR PROMOTERS.
SIMILARITY: CONTAINS 2 ZINC-DEPENDENT PHORBOL-ESTER AND DAG
BINDING DOMAINS.
SIMILARITY: CONTAINS 1 C2 DOMAIN.
SIMILARITY: CONTAINS 1 C2 DOMAIN.
SIMILARITY: BELONGS TO THE SER/THR FAMILY OF PROTEIN KINASES.
